

DIGITAL PRODUCT

AP Agent OS — Professional

The full operating system: method, sixteen agents, controls, measurement, economics and the twelve-step start-here.

What you have bought

The Professional operating system is the full design layer: sixteen agents, the ten-step method, taxonomy, controls, KPIs, economics, test and shadow method, and the templates. It is licensed to one named professional user. It is not software hosted by Evidence Room and not a substitute for your ERP or AP platform.

START HERE (Professional)

1. 01 Quick Start — this page and the 12-step path.
2. 02 Assess current state — Diagnostic + maturity + baseline sheet.
3. 03 Map the process — Observe→Structure templates.
4. 04 Select the first agent — decision table in Agent Library.
5. 05 Write the charter — use the agent PDF, exclusions first.
6. 06 Define controls — matrix rows for that agent.
7. 07 Establish KPIs — one operational, one financial range, one risk gate.
8. 08 Test — historical cases and adversarial injection cases.
9. 09 Shadow — production data, no action rights.
10. 10 Deploy — Level 1 or 2 only.
11. 11 Measure — four-week window.
12. 12 Expand responsibility — A16 recommendation, human decision.

Method (ten steps)

Step	Name	Output	Quality gate
1	Observe	Recorded walkthrough notes	Real invoices, not the SOP wall chart
2	Transcribe	Transcript with speakers	No confidential extras stored in a consumer tool
3	Extract	Steps, systems, rules, exceptions, controls	Every decision has an owner
4	Structure	Map, tree, taxonomy, RACI, SOP	Exceptions coded
5	Agentise	Human / recommend / prepare / execute / deterministic	Execute is rare
6	Test	Scored historical set	Gates written before seeing scores
7	Shadow	Parallel decisions, no writes	Disagreement log
8	Pilot	Bounded users / vendors / categories	Kill criteria agreed
9	Measure	Vs baseline	Controller sees the pack
10	Expand	Level change request	Evidence window complete

Control themes

Align with NIST AI RMF functions (Govern, Map, Measure, Manage) and ISO/IEC 42001 themes. This product does not certify you against either. Payment agents treat invoices, emails and statements as untrusted input (indirect prompt injection). Confabulated amounts are a control failure, not a curiosity.

Economics stance

EVIDENCE · AP-001, AP-009, AP-019, AP-023

External all-inclusive cost per invoice is still reported near USD 9–10, with best-in-class near USD 2.78 (Ardent 2024). IOFM has also observed fully automated teams above USD 20 unit cost when volume does not support the stack. Deloitte (2026) found 63% of finance teams using AI and 21% reporting clear ROI. Design the case so a sceptical controller can change every input.

Implementation phases

Phase	Intent	Typical elapsed (illustrative)
0 Baseline	Measure what you refuse to guess	1–2 weeks
1 Discovery	One process, real cases	1–2 weeks
2 Specify	Charter + controls + KPIs	1 week
3 Access	Read models of invoice/PO/GR/workflow	Depends on IT — often the critical path
4 Prototype	Offline packet on historical files	1 week
5 Historical test	Labelled set	1–2 weeks
6 Shadow	Live, no action	2–4 weeks
7 Controlled execution	Level 2/3 guardrail	2–4 weeks
8 Review	Promotion or rollback	1 week
9 Progress	Widen population, not level first	Ongoing
10 Scale	Next agent	After evidence

A single well-bounded agent can move in 4–6 weeks when data and owners exist. Say so — and say that systems, controls, integrations, data quality and governance change the clock.
